Looking for family physicians interested in primary stroke prevention study

Family physicians play a key role in primary prevention of stroke.

We invite you to participate in a research study exploring the barriers and strategies of family physicians for explaining stroke risk and stroke prevention to patients.

The purpose of this study is to understand how to promote stroke literacy in patients through improved discussions with their family physician.

The study involves a 2 hour focus group at a pre-determined location and a short questionnaire about stroke knowledge.

An honorarium will be provided for your time, and refreshments will be served during the focus groups.
